

Jovie

Help artists release more music.

- **Stage:** MVP built, incorporated, \$25K angel committed
- **Mission:** Remove the work around every release

The Problem

Artists quit before they learn what works.

- Every song is a test, but most artists only get 1-3 launches a year
- The work around each release turns each song into a months-long project
- Fewer releases means slower learning and weaker signal on what fans actually want
- Artists run out of money, time, or motivation before they learn what works

The Solution

Jovie closes the release iteration loop.

- Connect Spotify once
- Auto-build smart links, fan capture, release notifications, and AI playlist pitches
- Turn every release into a faster learning loop with audience context attached
- Use the link in bio as the wedge and release context as the moat

The Product

Release infrastructure now. Context and orchestration next.

1. **Import** catalog and profile from Spotify once
2. **Generate** smart links, CRM capture, release notifications, and AI playlist pitches
3. **Capture** fan behavior across every release touchpoint
4. **Accumulate** context on catalog, audience, collaborators, and outcomes
5. **Add** workflow, humans, and agents on top of that context

Why Now

Creation is abundant. Coordination is scarce.

- AI makes music creation cheaper and faster
- Independent artists now drive half of all streaming royalties
- Live music keeps growing as fans pay more for real artists
- The post-release workload is still manual and fragmented
- The system that removes manual release work wins

Differentiation

What makes Jovie different from Linktree, Linkfire, and the rest.

- **Release system, not profile surface** — Jovie owns the release loop, not just the page
- **Music context built in** — catalog, fans, collaborators, and release history live in one place
- **Faster learning loops** — more releases, more signal, faster insight into what fans actually want
- **Natural path to orchestration** — the wedge already owns the context generic PM tools do not

What We Measure

Early, measurable KPIs with a simple value ladder.

- **Release velocity:** releases shipped per artist over time
- **Capture rate:** profile views → email/SMS signup
- **Activation rate (24h):** captured → meaningful action (listen/follow/save/tour intent)
- **Release-loop activation:** release created → notification sent → pitch generated → fan action
- **Value events per fan/week:** streaming clicks + follow/save + ticket/merch intent
- Weighted event scoring before full purchase attribution is available

Roadmap

Three phases from release infrastructure to orchestration.

- **Phase 1:** Release infrastructure wedge
 - Spotify import, smart links, CRM, release notifications, AI playlist pitches
- **Phase 2:** Context layer
 - Release history, audience intelligence, collaborator graph, learning loops
- **Phase 3:** Orchestration layer
 - Release workflow, task routing, human/agent roles, team from day one

Founder

Tim is a creator + operator who has been on both sides.

- Drove 90M+ streams to his own music
- Signed to Armada and Universal
- Spent 3 years at Bravo building marketing experiences for major artists and brands
- Building Jovie full-time with AI-assisted development

Funding

Angel round — proving artists reach fit faster.

- **Committed:** \$25K angel check
- **Use of funds:** Harden onboarding, deepen the release loop, onboard the first cohort, and ship the first orchestration surfaces
- **Near-term milestones (60-90 days):**
 - Onboard the first paying cohort and prove the wedge with non-founder artists
 - Show artists using Jovie to ship releases with less friction
 - Validate retention around the release loop
 - Ship the first workflow/orchestration surface on top of live context
